

Poweruser Bot

1. What does PowerUser do?

On my Discord Server we want to give a special Role to the most active People (Top 3 Voice Activity + Top 3 Chat Activity) to reward them for their activity. In that special Case we have 2 different Roles. One Role is called “Poweruser”, and one is called “Active Perks”. “Poweruser” is the Role for the Top 1 People, so the Person who has the most hours spent in Voice Channels and for the one who has sent the most Chat Messages. The 2nd and 3rd active Person will all get the “Active Perks” Role.

Let me give you an example:

Top Voice Activity

James – 50h spent in Voice Channels

Michael – 30h spent in Voice Channels

Jody – 10h spent in Voice Channels

Top Chat Activity

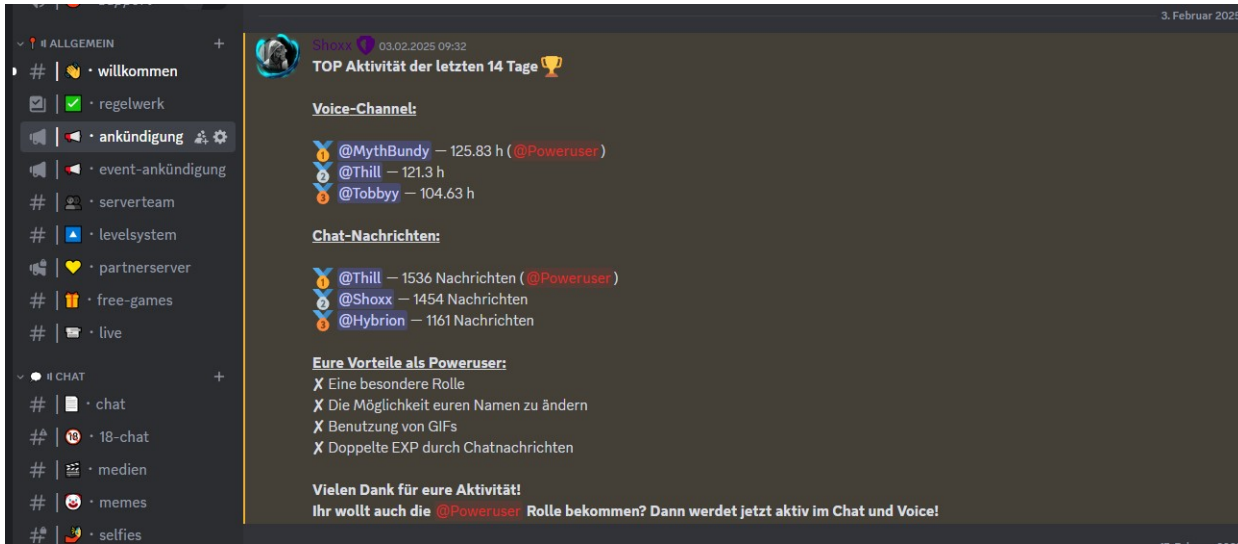

Sheila – 1.000 Messages sent

Mike – 500 Messages sent

Abdul – 150 Messages sent

In this case James and Sheila will get the “PowerUser” Role for being at the absolute Top and Michael, Jody, Mike and Abdul will all get the “Active Perks” Role.

In addition to the Roles that get assigned, we also make a Server announcement Post in our announcement Channel. This looks like this:

(Example of how the Announcement looks like – It is written in German, but I think you’ll get the point)

This announcement includes mentioning the Top 3 People of both categories, the number of hours they spent in Voice Channels (For the top Voice People), the number of messages they sent (For the top Chatter) and some other predefined information like a “thank you” message and a short information on what perks they will get for being at the top.

Right now, we have defined a period of 14 days on which we swap the Roles and make the announcement, based on the activity data of the previous 14 days.

Sadly, we must do all that by hand which costs a lot of time and effort.

We must manually check the Voice + Chat Data with a separate Stat Bot we have on our Server, note down the Data, and manually put them together in a Message that looks like the example that I just mentioned to you with the Screenshot above. We also must remove the Winner Roles from the old Winners and assign them to the new ones by hand.

2. What should the Bot do?

Basically everything! The Bot should do all the things that we now do manually, with the addition of some more features.

It should count Voice and Chat activity by itself, post the Message with the Winners (Like my message on the example Screenshot above), unassign the Winner Roles from previous Winners and assign the matching Roles to the current Winners.

We basically feed the Bot with information like what Roles he should assign, what Channels he should not consider and at what period he makes a cut, assigns the Roles and does the Winner announcement Message.

And from then on, everything is fully automatic without us needing to interact at all.

Instead of explaining every single aspect of the Bot, I think its easier to check the “Commands” Section further below to get yourself an idea of what the Bot should do and how it should look like.

3. Commands

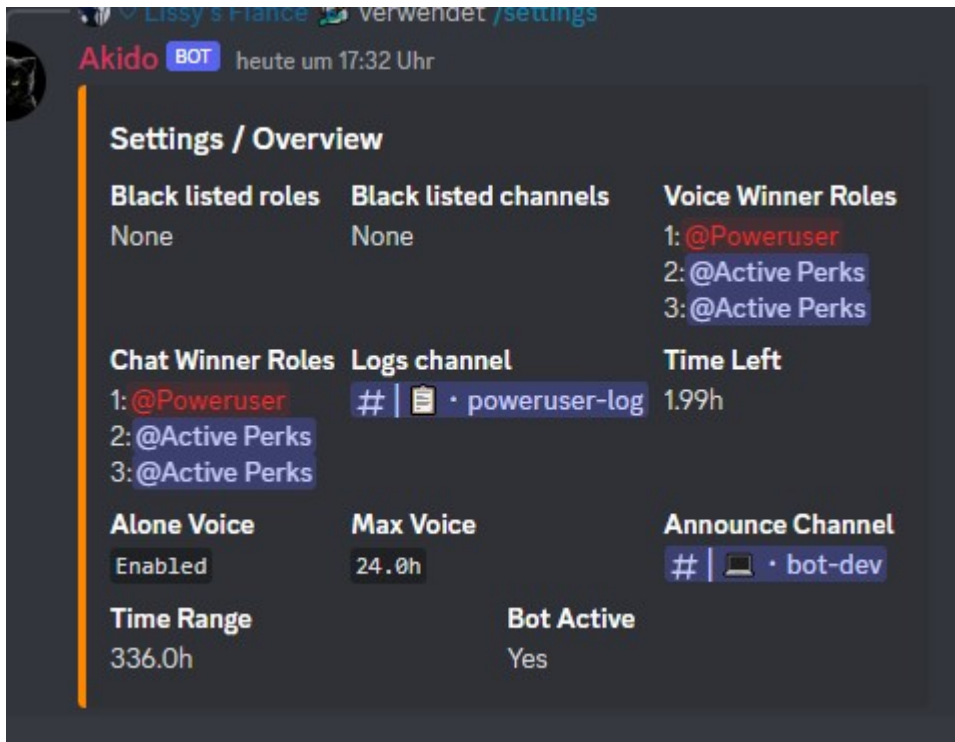

To get a better understanding of all the functions the Bot has, I will explain every command that it has and what this command should do. As mentioned, not all of them are working as they should, but I will explain how it should be if everything works perfectly.

Maybe you even find ways to make some Commands better or even remove them while optimizing other Commands to do its job instead. I don't care about the Commands at all, all I care about is the function of them. So, if you think you can optimize some Commands, do it please! If no function of the Bot gets lost, I'm super happy with it.

To explain the functions, I will just look at what Commands the old Coder made for me and explain step by step what I want them to do.

List of Commands:

/Settings

(Old Screenshot of the Settings Overview that I found)

This Command shows a summary of all taken Options for the Bot.

It shows what Roles/Channels are on the Blacklist, the Roles that get assigned for the Top3 of Voice/Chat, the Channel the Bot posts its Logs in, the Time left until the next Cut, if the Alone Voice Option is enabled, the Max Voice Time (Maximum hours per day that gets counted into Voice Activity) the Channel the Winners Message gets posted in, the Time Range when the Bot Makes a Cut and if the Bot is currently active.

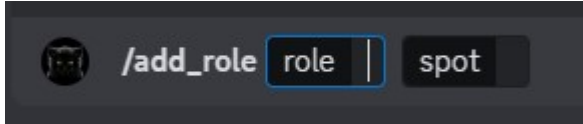

/Active

Activates the Bot

/Deactivate

Deactivates the Bot

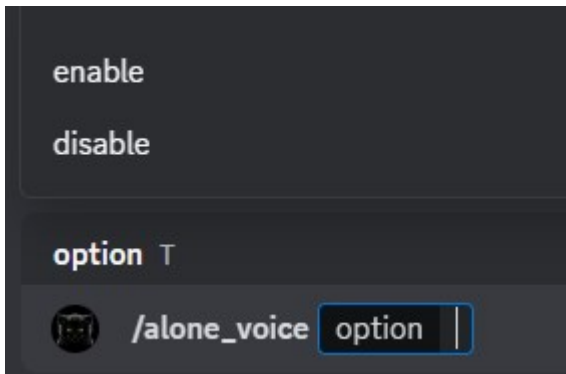

/Add Role

This Command lets me define which Role will get assigned for which spot.

This should also have to Option to leave the Role blank, so for example if we at some point decide to only reward the Nr. 1 Spot we should have to ability to ignore Roles for 2nd and 3rd Spot.

/Alone Voice

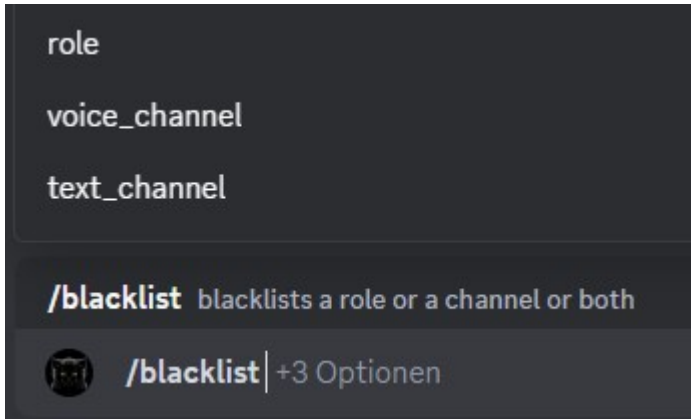

This Command enables or enables the Alone Voice Function. This means that I can enable/disable if a person gets counted into the Leaderboard when he is alone in a voice Channel or if at least 2 People need to be in the same Voice Channel to get their activity added into the Leaderboard.

With this Option I want to have the ability to stop people from farming themselves into the Top of the Leaderboard by being in Voice Channel 24/7 alone.

/Announce

This Command is confusing. Its description says “Announcing winner in x days” but I think what it should do is letting me define in which Channel the Bot will Post the Winners Announcement Message. Have to Check in the Code what it actually does.

/Blacklist

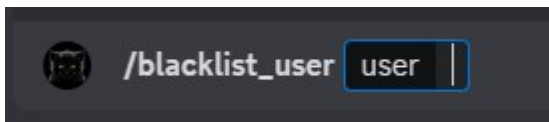

With this Command it should add Roles or Channel that should get ignored by the Leaderboard of the Bot.

So for Example if I create a “NO REWARDS” Discord Role, all People that have this Role will not get counted their Messages or Voice Activity at all. The Bot just ignores them by adding up the Stats for its Leaderboard.

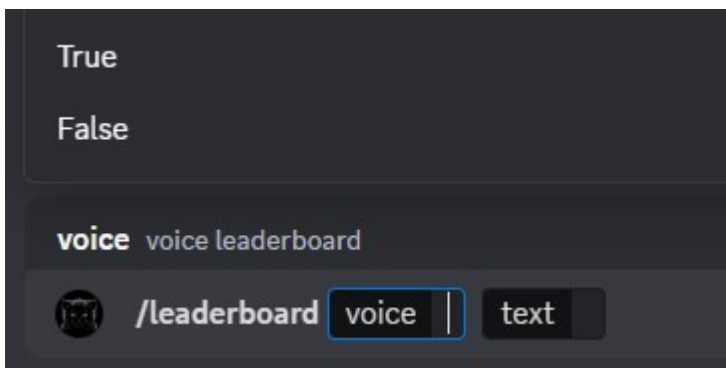

Same should go with the Voice/Text Channel Options. Channels that are added here should not be considered at all for the mentioned Category (Voice or Text).

/Blacklist User

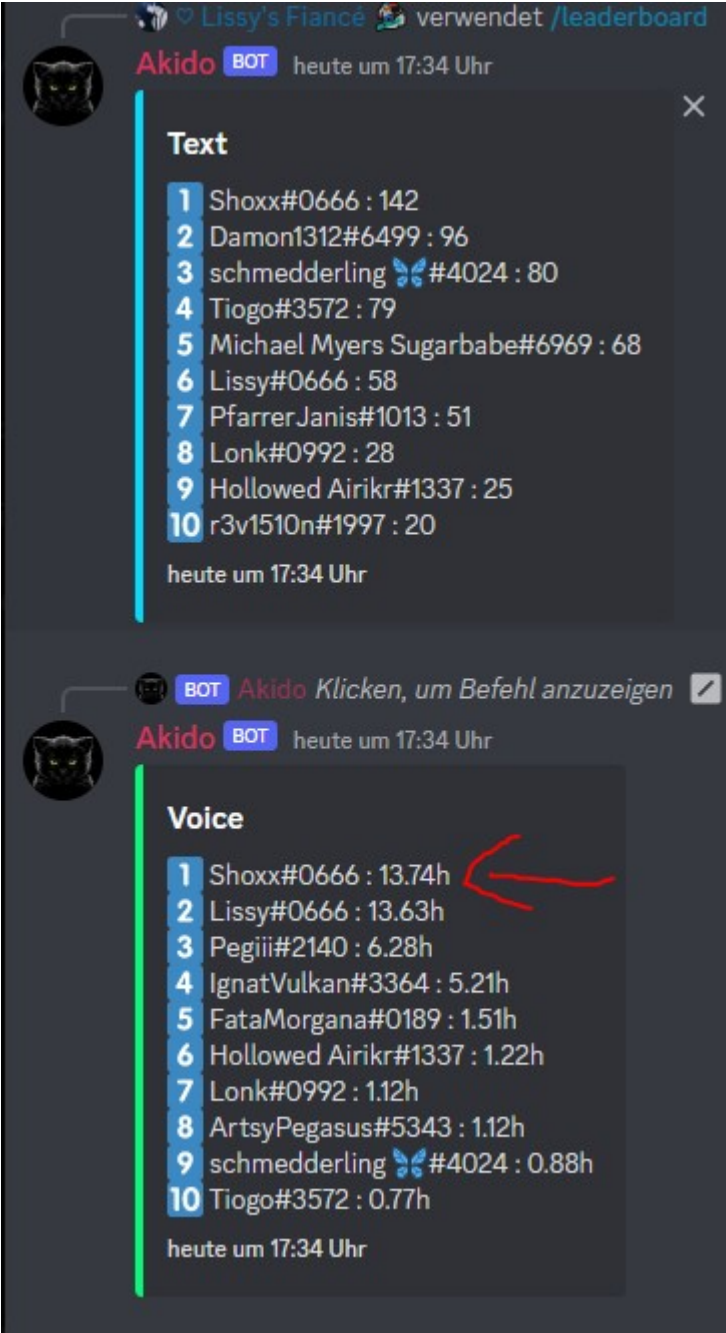

Same as the /Blacklist Command above, this should block specific Users from not getting into the Leaderboard at all. No idea why he made 2 different Commands for this.

/Leaderboard

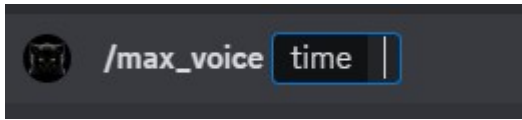

This Command lets me see the Current Leaderboard of Chat or Voice. I think this is Limited to only the Top10 of both Categories, which is fine!

(Old Screenshot of the Leaderboard that I found – Ignore the Arrow that I drew on it, it's irrelevant for now)

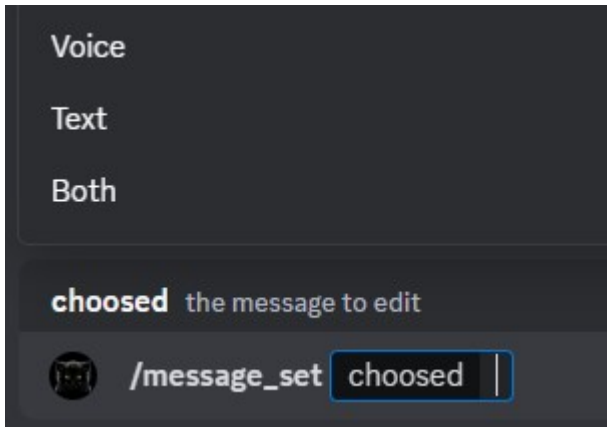

The Embeds look super poor, maybe there is a better way to display the Leaderboard.

/Max Voice

This Command lets me limit the maximum of time for the Voice Activity per day. So If I put like 2h in there, activity per day will only get taken into account for 2h and all activity that gets farmed above this is ignored by the Bot and wont be added to the Leaderboard.

/Message Set

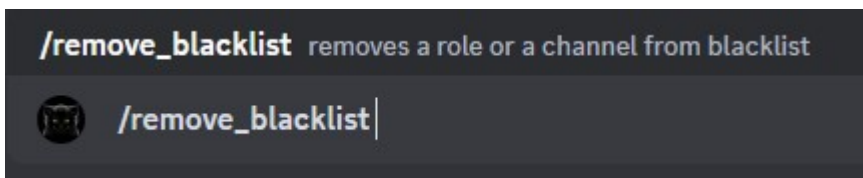

I'll be honest, I have no idea what this does. I think this should've been the Option to design the Message that the Bot Posts to announce the Winners after every Cut.

I have no idea why it lets me choose Between Voice, Text or Both at all since the Message is ONE Message that includes every information anyways.

Whenever we had to change the Design or the Winners Message itself we always did it in the Source Code File and not over this Command anyway, because this was way easier to design it rather than doing it on Discord itself with this Command.

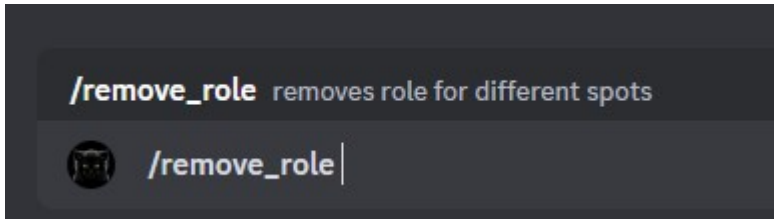

But we need to have the ability to change the Message the Bot sends somehow. It's okay if I must change it in the Code of the Source file as long as I could tweak it a bit, whenever I need to.

/Remove Blacklist

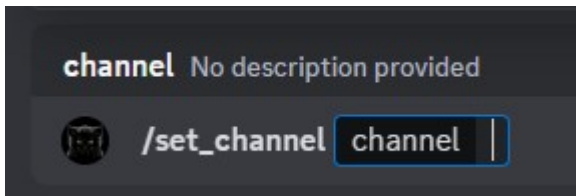

This should let me remove any Channel, Role or Person from the Blacklist.

/Remove Role

Not exactly sure how this works but I think this was his solution to blank out a Role. So right now we have “Poweruser” For Spot 1 and Spot 2+3 will get the Role “Active Perks”. Maybe this was his Option to achieve the function to only Count Top1 and ignore the 2nd and 3rd Place of each Leaderboard.

/Set Channel

This Command again is super purely named. This is for Setting the Logs Channel. Cause when the Bot reaches it Cut Period and Posts the Winners Message and assigns/unassigns the Roles, it Logs it in a here defined Channel.

I can show you how this looked like: (See next Page)

Akido APP 14.05.2023 00:22

- ✗ Removed 'Active Perks' from Shoxx#0666
- ✗ Removed 'Poweruser' from schmedderling #4024

- 🔄 The leaderboard has been reset!

(Old Screenshot of the Leaderboard that I found – Ignore the Arrow that I drew on it, it's irrelevant for now)

The Bot basically posts which Roles he removed and which one he assigned to people. It also mentioned the Channel where the Winners Message has been sent in and that the Leaderboard has been reset.

/Timerange

As mentioned above this Command is confusing since it kinda collapses with the above mentioned /announce Command

This Command here is described as „defines the timerange in which the Bot will announce”
The /Announce Command describes as this

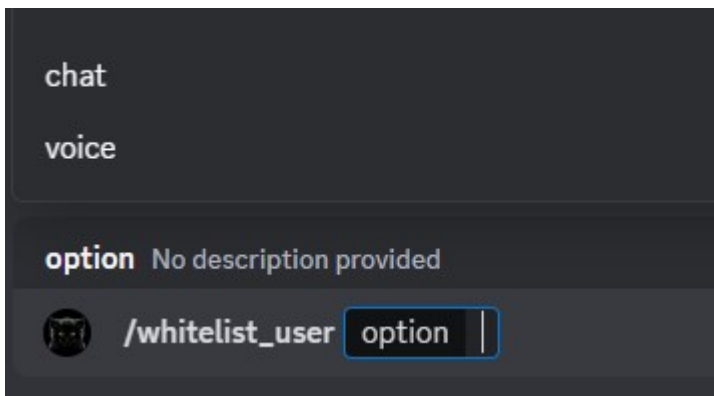

which is the same.

Not sure what both of this Commands actually do, I think you need to check in the Code. But what they SHOULD do is:

/Announce = Defines the Channel where the Winners Message is posted in

/Timerange = Defines the Timerange when the Bot does a Cut and Resets

/Whitelist User

To be honest, no idea what this is. I think it was his way of removing People from the Blacklist again?

4. Known Bugs

I have no idea what actually does work and what does not but from the Chat that I still have with the old Coder I know that we have problems with the following things for sure:

- Some Commands (Not sure which) do not react in Discord, they just respond with an “Application is not answering” type of Text
- Voice hours do not add up properly. Im not sure if this is in relation to the “Voice Alone” Function which does not work properly but I remember that the Minutes/Hours you spend in Voice Channel had a Problem with them being counted into the Leaderboard.
- Blacklist does not work properly. I could not add Roles / Channels / etc. to it. It did say so but when you run the /Settings Command they don’t show in the Overview. This may have the reason that the config of the Bot had a fuckup when it comes to deleted Channels. So lets say ChannelX is on the Blacklist, but we deleted ChannelX on our Discord but did not remove it from the Blacklist beforehand, the Bot has a hiccup.

I found that Screenshot that I sent the Coder back in the days, showing him that these Channel still exist in the Config even thou they are deleted in Discord itself. This fucked up the Bot config I assume, so maybe we need to find a fix for that aswell.

```
blacklist.json
1 [{""627167162174339092": [], "798583817195225109"4 ["1001754537532600380", "1011644019484409897", "1043938225263222845"", "1046168858643398656", "1001713289463615570""]}]
```

- Voice Time does not get added correctly after the Bot reaches its Period and makes a Cut + Resets the Leaderboard. That’s what I originally wrote to the Coder of the Bot a year ago “After the reset, time gets lost until you disconnect once. First disconnect of voice after the reset does not add the time from Reset to Disconnect, it only enables you to connect hours again”

5. Conclusion

So I think right now you should have good overview of what the Bot should be able to do.

As you may already noticed is that the Bot is really purely Coded and the Commands are not only poorly Named but also poorly in their function. I think the Blacklist for example could need a complete rework of how it adds and removes objects from it.

Not sure if it makes sense to try to fix the Code for this Bot or just kinda remake it in a better way.

Same Functions but just better Coded and better when it comes to Commands.
