

# Moderation System

## (Warn + Kick/Ban + Userinfo)

### 1. Foreword

For moderation purposes on our Discord server, we use a warning system. The number of active warnings determines the level of restrictions and reaching a certain threshold results in a ban from the server. We are using the well-known Dyno Bot for both actions.

**Lawliet Bot:** <https://lawlietbot.xyz/>

**Dyno Bot:** <https://dyno.gg/>

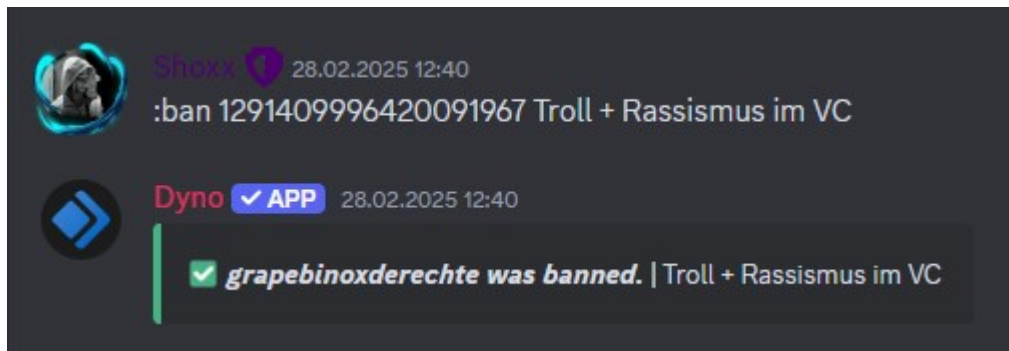

### 2. Current State

#### 2.1 Kick/Ban Command(s)

**/Ban** [@User/UserID] [Reason] and **/kick** [@User/UserID] [Reason]

- We use this command to execute a kick/ban
- Upon execution, it provides a confirmation embed stating something like: "Successfully kicked/banned {@User}."
- The bot also sends a DM to the kicked/banned user, stating: "You got banned on {DiscordName} by {PersonWhoBanned} – Reason: {Reason of the Ban}"
- The bot also automatically sends the user a DM with our unban form in case the person got banned
- When banned, the bot removes all the latest messages from that user out of the server

Example of the command:

**/Unban** [@User/UserID] [Reason]

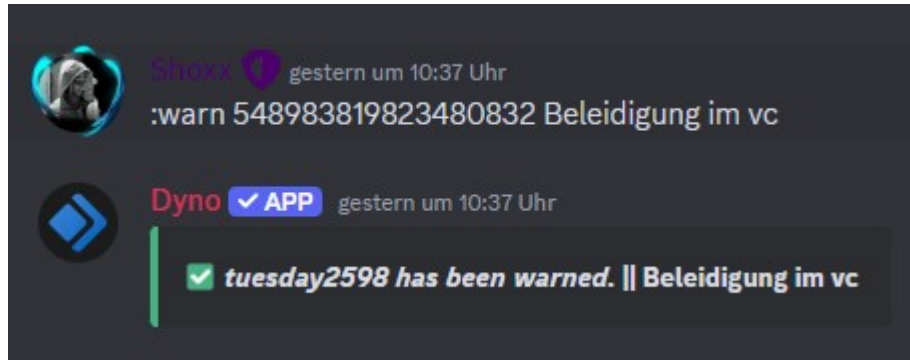

- Unbans a person
- Confirmation via Embed
- Sends a DM to the unbanned user, informing them that they have been unbanned, by whom, and the reason for the unban

## 2.2 Warn Command(s)

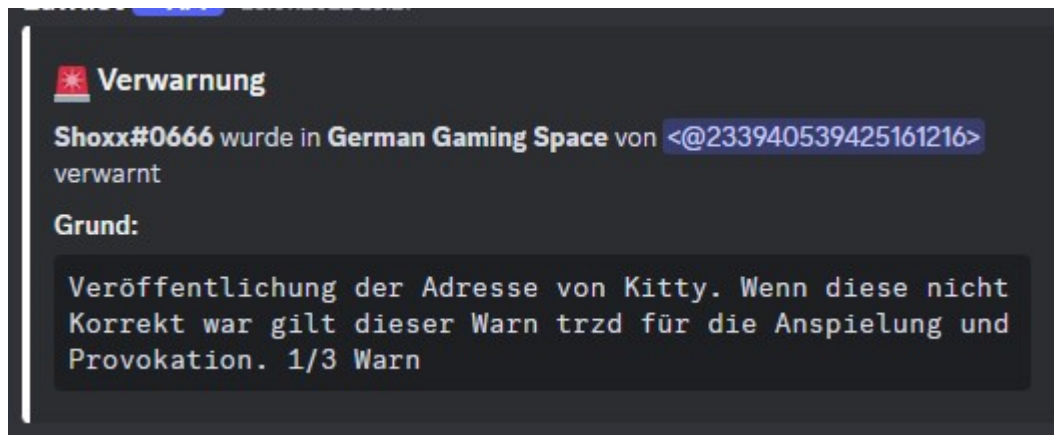

**/Warn** [@User/UserID] [Reason]

- This command adds a warn to the desired user
- It gives a confirmation embed which also mentions the reason for the warn
- The warned user gets a DM mentioning the warning, the issuer, the server and the reason of the warning

Example of the command:

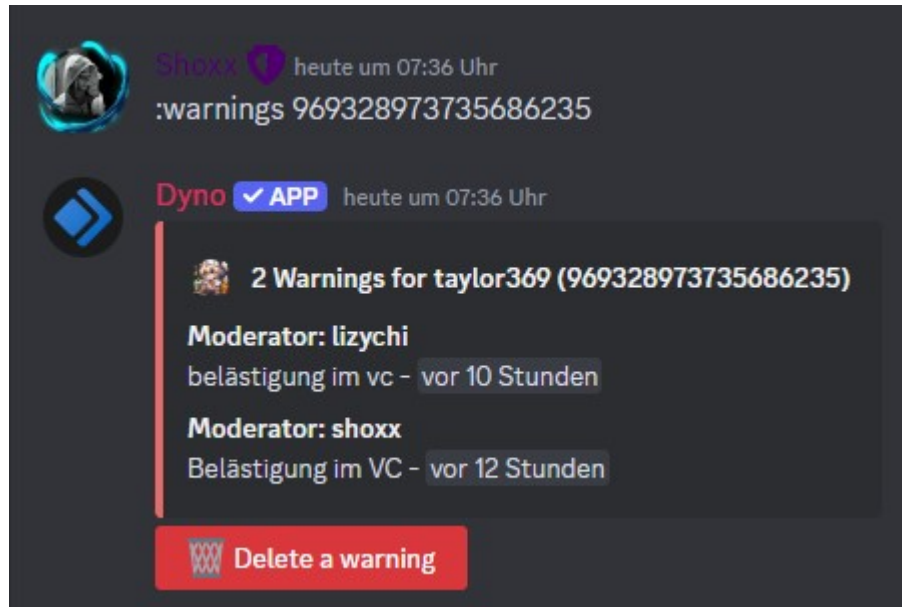

Example of the DM when getting warned:

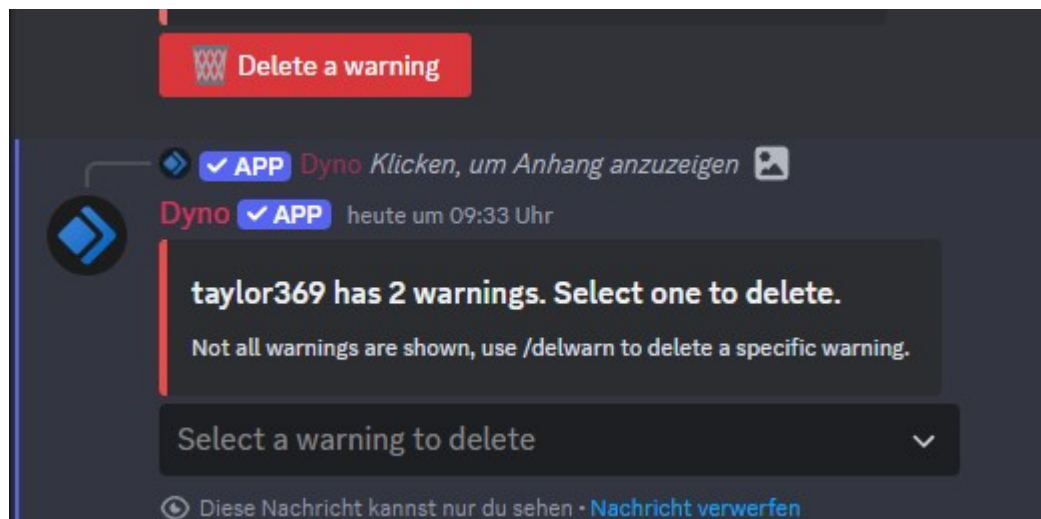

## **/Warnings** [@User/UserID]

- This command shows all active warnings for a user
- It displays the information in an embed, including key details such as the date of the warning, the issuer, and the reason. At the top, it also mentions the user and their total number of active warnings
- At the bottom of this embed there also is a button to delete a warning. When clicked, it lets you choose which of the current active warnings you want to delete

Example of the command:

Example of when you click the 'Delete a Warning' Button:

(See /Delwarn command to get more information about this)

## /Mywarns

- Displays all current warnings for the user itself
- This command can be used by every Member of our server to get information about all their current active warnings

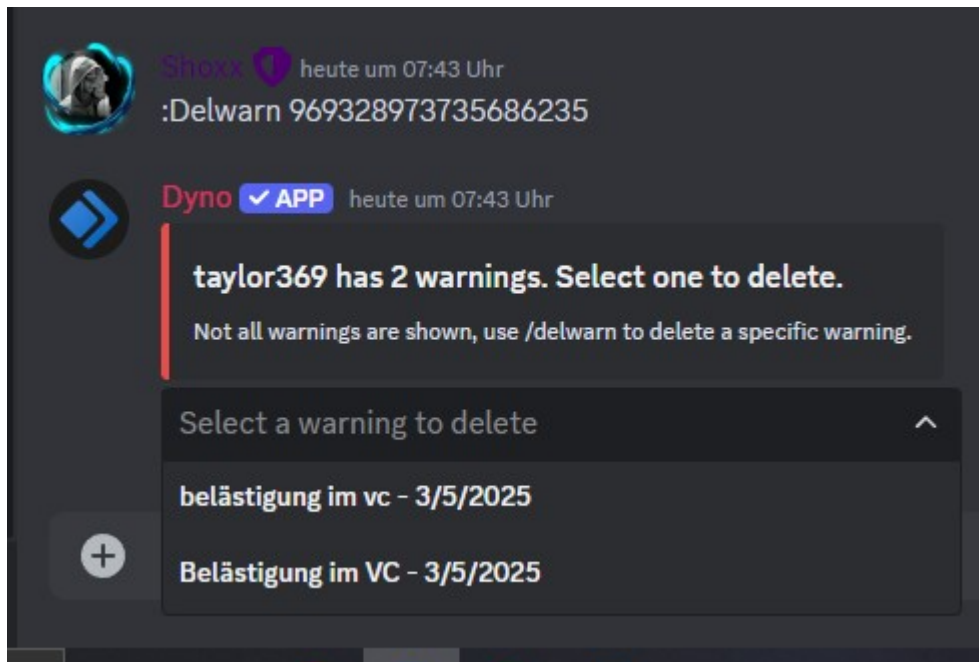

Example of the command:

## /Delwarn [@User/UserID]

- It provides a dropdown menu where you can select which active warning to delete
- When a warning is removed—whether through this command or via the /warnings command—the user receives a DM notifying them that the warning has been revoked

Example of the command:

## 2.3 Userinfo Command(s)

/Userinfo [@User/UserID]

- Currently, we use Dyno Bot and Lawliet Bot for this, each displaying information in their own unique way. Both bots have their advantages
- This command provides key account details, such as roles, join date, registration date, user ID, server nickname, and other relevant information

Example of the command for Dyno:

Shoxx 26.02.2025 07:43  
:userinfo 227330563214671872

Dyno APP 26.02.2025 07:43

Example of the command for Lawliet:

The screenshot shows a Discord chat interface with a dark theme. At the top, a message from user 'Shoxx' (verified) is shown with a timestamp of '03.03.2025 19:25'. The message content is 'l.userinfo 227330563214671872'. Below this, a response from 'Lawliet' (verified app) is shown with a timestamp of '03.03.2025 19:25'. The response contains a 'User-Infos' section with a list of user details and a small profile picture of the user 'shoxx'.

### 3. What we need / How we want it to be with our (your) own Bot

As always, these commands are unfinalized placeholder examples meant to illustrate their functionality. Their names are not final, and their purpose is to demonstrate their general intent. You can add or delete commands as needed, as long as the core functionality we aim to achieve remains intact. Same goes for the messages within embeds.

The bot's core functions should remain largely the same as they currently are, with improvements to existing functionalities and the addition of a couple new ones.

The permissions to use the bot's commands should be manageable through the permissions control system you've already implemented. This will allow me to control which roles or users can access and execute specific commands.

The ban process is straightforward: it's just a normal command that triggers a confirmation embed upon execution, along with a DM sent to the user who gets banned.

The warning system remains largely the same, but with improved embeds that provide more detailed or better-organized information. Additionally, a log channel will be created where all warnings (along with their details) and unwarnings are listed. Other features will include automatic removal of warnings after a certain period.

It would be useful if, for commands where the bot sends a DM to a user, it checks whether the message was successfully delivered. The bot could then mention this in the embed of the specific command, so we know whether the user received the information or not.

### 3.1 Kick/Ban Command(s)

**/Ban** [@User/UserID] [Reason] [Purge:NO] and **/Kick** [@User/UserID] [Reason]

- This command will kick/ban the user and lets us add a reasoning to this
- Upon execution, it must provide a confirmation embed stating something like: "Successfully banned {@User}."
- The bot also must send a DM to the kicked/banned user, stating: "You got kicked/banned on {DiscordName} by {PersonWhoBanned} – Reason: {Reason of the Ban}" and add our unban form to this message when the action was a ban.

I think it's important to send the DM first, then execute the ban command, because you can't send messages to users you don't share a server with. If we execute the ban before the message, it won't be delivered since the bot and the user aren't on the same server. Therefore, the message must be sent milliseconds or seconds before the ban takes place

- When a user is banned, the bot should automatically purge their last messages from the server by default, if possible. However, it should also provide the option to leave all written messages intact. This can be controlled with an optional variable at the end of the /Ban [UserID] command
- When the kick/ban command is executed, it should ask for confirmation — possibly with an embed maybe? — while also mentioning the user inside of this. For example:

*"Are you sure you want to ban @User?"*

This double confirmation helps ensure that we've entered the correct UserID by displaying the username, preventing accidental bans. My example message is just a rough placeholder; we'll need to refine it later to ensure it looks and sounds polished.

**/Unban** [@User/UserID] [Reason]

- Unbans a person
- Confirmation via Embed
- Sadly I don't think we can send the user a confirmation DM when they are unbanned, because you can't send DMs to users you don't share a server with. Since the bot and the banned user don't share a server, the message wouldn't be delivered. Or is there any workaround for that?

## 3.2 Warn Command(s)

### **/Warnlog** [Channel]

- Lets me define in which channel the logs of warns will get posted in (In embeds of course)
- The logs should include embeds for every action related to a warning, whether it's applied or removed. This applies to actions taken by the server team or automatic removals when the warning's duration expires
- Logs should also be detailed and include the reason for the warn/unwarn, its issuer, etc.

### **/Autojail** [Yes/No]

- Toggles on/off the Autojail feature
- Autojail feature means then when a person gets added a warning the bot checks if he has  $\geq 2$  current active warnings. In that case it triggers the /Jail function on them
- In case the Jail is triggered we need a confirmation embed for this so we as serverteam notice what happened
- It should not automatically jail users with 2 or more warnings. Instead, it should only trigger the jail action when a new warning is applied, at which point the bot will check if the user has 2 or more warnings and then jail them
- Im not sure if this function is codeable but it would be really cool

### **/Warn-standard-duration** [Duration: In days maybe?]

- It allows us to define the duration of a warning before it gets automatically deleted. Within the /warn command, we want to include the option to specify how long the warning lasts, though this should be an optional variable field. If the optional field is left empty, the command should define the default duration for warnng.
- It should also have the option to be toggled off or set to indefinite. This flexibility is important, as we may later decide that warnings should remain permanent.
- Any changes we make here should only apply to future warnings and not affect those that have already been applied.

### **/Warn** [@User/UserID] [Reason] [Duration]

- This command adds a warn to the desired user for a specific reason
- It gives a confirmation embed which also mentions the reason for the warn
- The warned user should get a DM with all relevant information (Issuer, server, reason of the warn and when it expires)
- As mentioned within the /Warnlog command the relevant information should be logged within the log channel

### **/Unwarn [@User/UserID]**

- Same as the current /Delwarn Command (See above)
- This command displays all current warnings for a user and allows us to choose exactly which warning we want to remove. It would be helpful if this is presented in a dropdown, similar to how it's currently implemented
- After selecting which warning we want to remove, a popup could appear where we can enter a reason for the warning removal
- Should give a conformation embed when a warning gets removed, which mentions the relevant details
- The bot should send a DM to the user whose warning was removed, providing details about the removal, including who removed it, what was removed, and any relevant information.
- Logs the removal (With all relevant details) in the log channel

### **/Mywarns**

- This command should provide the executor with information about their current active warnings, including all relevant details
- It would be ideal if the command is silent, without any confirmation embed, and the information is sent to the user via DM instead of on the server if possible. Or tells them the information within this private kind of embed which can only be seen by the person itself. Might be better since some people have DMs disabled and wont get the desired information then
- Would be good if we get a message in our log channel that says something like "UserX checked their warnings"
- This only gives information about current active warnings and no administrative permissions/actions since this command can be used by ANY Member on the server!!

### **/Warnings [@User/UserID]**

- This command shows all active warnings for a user
- It displays the information in an embed, including key details such as the date of the warning, the issuer, and the reason. At the top, it also mentions the user and their total number of active warnings
- At the bottom of this embed there also is a button to delete a warning. When clicked, it lets you choose which of the current active warnings you want to delete
- The function remains the same as the current command (see above), but we may enhance its functionality or improve its appearance
- It should provide every kind of information that is relevant and good to know

### 3.3 Userinfo Command(s)

**/Userinfo** [@User/UserID]

- Refer to the current state of the command above; it should be similar to that. We are currently using Lawliet or Dyno for this, with examples provided earlier. For our own bot, we aim to combine the best features of both bots
- We need all relevant information to get a comprehensive overview of the user, including their avatar, join date, Discord account creation date, all roles they have (similar to Dyno Bot in the example above), and any other relevant details
- It would be very cool if in addition to that we also see the current warnings of the user underneath
