

Sticky Roles

1. Foreword

On our server, we have certain roles—such as Level Roles and the Verification Role—that should be automatically reassigned to users if they leave the server and later return.

To achieve this, we need a system that allows us to define specific roles as "Sticky Roles." When a user with one or more of these roles leaves the server, the bot records their User ID along with the assigned sticky roles. If the user rejoins, the bot checks whether they previously had any of these roles and automatically restores them.

2. Current State

We are currently using this feature from another bot, but since that bot is unreliable, we want to replace it with our own.

3. How it should be in the future with your Bot

3.1 Functionality

As mentioned above, this is not an auto-role feature where every user receives the same roles upon joining the server. Instead, users only regain the roles that were defined as sticky and that they had before leaving the server.

We have around 10-15 users leaving the server each day. Considering that each of them, in the worst case, has 1-2 sticky roles, the amount of data stored will only be a few bytes, right? The file where this data is stored might get long in terms of text, but the size should still be manageable since it's only a small amount of data.

We need to implement a system where, when a user joins, the bot checks if their ID exists in the stored data. If it does, the bot will check the roles currently defined as sticky. Then, it will compare these sticky roles with the roles stored in the user's previous data. If there's a match, the bot will assign the corresponding sticky role to the user.

We also need to consider potential errors that may occur. For example, if we define "Role1" as a sticky role, and a user leaves with this role, their data (including the role) will be stored in our files. Later, we might decide to remove "Role1" from the sticky roles list. When this user rejoins the server, the bot might find the sticky role in the data file, but since it's no longer a sticky role, what happens? Will this cause an error, or will the bot simply ignore the role since it's no longer defined as sticky?

I'd appreciate your opinion on whether this can be implemented effectively, both from a coding perspective and regarding file size management. Are there any potential issues, or would it be better to reconsider this functionality?

3.2 Commands

/stickyrole-role [Add/Remove] [Role]

- This command adds or removes a sticky role from the configuration.

/stickyrole-config

- This command displays whether the sticky roles module is enabled or disabled and lists the roles currently defined as sticky.

/stickyrole [Enable/Disable]

- This command enables or disables the sticky roles function.
