

Verify-System

1. Foreword

On our server, users can verify their age, and if they do so, they are assigned the "18+" role, granting them access to additional adult channels. Since assigning roles in Discord requires the "Edit Role" permission, I don't want to grant this permission to too many people. Instead of giving users this permission to manually assign the role after verification, I let the bot handle the role assignment. This way, users can only assign the "18+" role and no other roles, ensuring control over permissions.

2. Current State

Currently, we assign the "18+" role manually by clicking on the person, clicking the "+" button on their profile, searching for the role, and then assigning it to them.

3. How it should be in the future with your Bot

3.1 Functionallity

The term "Verify System" sounds more complex than it actually is. Essentially, all it needs to do is give our Serverteam the ability to assign a single predefined role to other people.

You can think of this method as a streamlined way of assigning people a role, with the added benefit of not having to grant others access to assign all roles — only this specific one.

This process is complemented by a nice embed that announces something like, "Person X got verified by Person Y and received the role @Role."

Additionally, it would be great if, when verifying a person and assigning them the role, they receive a ping in specific channels, notifying them of the channels they now have access to. This ping should be deleted instantly after, serving only as a highlight for the person, with a big red ping next to the channel name.

As always, permissions for the commands should be manageable through our permission system. They should not be usable by default and should only be accessible to the roles/users I add to it.

3.2 Commands

/Verify-ping [Channel]

- This command should allow me to define specific channels in which the verified person will be pinged. As mentioned, these pings should be instantly deleted by the bot and serve solely as a notification to highlight the channels the person now has access to.
- It should also function in such a way that if no roles are set up, the command will still work, but it won't send any pings.

/verify-role [Role]

- This command allows me to define which role gets assigned when using the /verify command.

/verify-config

- This command shows the currently set-up role and the channels where pings are configured to be sent.

/verify [@User/UserID]

- This command adds the predefined role to the specified target.
- As mentioned above, this command sends an embed in the channel where it was used, announcing something like "UserX got verified by UserY and received the @Role." If the user already had this role, it removes it from them and sends an embed saying something like, "UserX's verification was revoked. The @Role has been removed."
